

PR50-38 Pressure Reducing/Relieving Spool Valve

DESCRIPTION

A screw-in, cartridge-style, direct-acting, spool-type, hydraulic pressure reducing/relieving valve, with internal pilot and internal spring-chamber drain. It is designed to act as a pressure regulating valve for secondary circuits. Internal damping makes this valve particularly suitable for use in circuits with unstable input flows in demanding applications requiring enhanced stability.

OPERATION

In its steady state, the **PR50-38** allows flow to pass bidirectionally from port ② to port ①, with the spring chamber constantly drained at port ③. Upon attainment of a predetermined pressure at ①, the spool shifts to block flow at ②, thereby regulating pressure at ①. In this mode, the valve will also relieve from port ① to port ③, at a variable value over the set reducing pressure. Tank port pressure is additive to the pressure setting at a ratio of 1:1.

FEATURES

- Adjustments cannot be backed out of the valve.
- Adjustments prohibit springs from going solid.
- Optional spring ranges to 227.5 bar (3300 psi).
- Hardened parts for long life.
- Industry common cavity.
