Spool variants

Minimum pressure 4 bar (58psi) with external drain (E), maximum pressure 200 bar (2901psi). With internal drain (I), at the minimum pressure (4 bar - 58psi), add the working pressure with ratio of 6,5:1. Example: With working pressure 100 bar (1450psi), minimum pilot pressure is 19.38 bar (281psi) ((100:6,5) + 4 bar (58psi)).

Functional description

A valve basically consists of a housing (1), a control spool (2), a return spring (3) and a solenoid (5). It is designed to select which one of two circuits (C1 or C2) is to be supplied with the oil delivered from one single hose (P): with spool in position "0", when the solenoid is de-energized, the flow goes from P to C1, with spool in position "1", when the solenoid is energized the flow goes from P to C2. With the coil de-energized, the return spring (3) pushes back the spool (2) and holds it in position "0".

The coil **(5)** is fastened to the tube by the ring nut **(6)**. The manual override **(7)** allows to shift the spool **(2)** also in case of voltage shortage.

An external drain **(4)**, to be connected to tank, ensures shifting operations also at higher working pressure. Hydraulic / pneumatic pilot control for spool shifting is available upon request.
