Spool variants

- 1) Minimum pressure 4 bar (58psi) with external drain (E), maximum pressure 200 bar (2901psi). With internal drain (I), at the minimum pressure (4 bar - 58psi), add the working pressure with ratio of 6,5:1. Example: With working pressure 100 bar (1450psi), minimum pilot pressure is 19.38 bar (281psi) $((100:6,5) + 4 \text{ bar (58psi)})$.
- 2) For connectors ordering code see data sheet RE 18325-90.

Functional description

A valve basically consists of a housing (1), a control spool (2), a return spring (3) and a solenoid (4). It is designed to connect two inlet lines **P1 – P2** (normally a set of hoses) and divert them to either the outlet ports (**C1 – C4**) with spool in position “0”, when the solenoid is de-energized, or to the outlet ports (**C2 – C3**) with spool in position “1”, when the solenoid is energized.

With the coil de-energized, the return spring (3) pushes back the spool (2) and holds it in position “0”. The coil (4) is fastened to the tube by the ring nut (6). The manual override (5) allows to shift the spool (2) also in case of voltage shortage. Hydraulic / pneumatic pilot control for spool shifting is available upon request.
