

Pilot operated check, pilot to open Common cavity, Size 10

VSOA-10A

Description

When pressure at 2 rises above the spring bias pressure, the poppet is pushed from its seat and flow is allowed from 2 to 3. The valve is normally closed (checked) from 3 to 2. When sufficient pilot pressure is present at port 1, the pilot piston acts to push the poppet from its seat and flow is allowed from 3 to 2. Precision machining and hardening processes allow virtually leak-free performance in the checked condition.

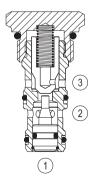

In case of valve application in redundancy systems it is especially recommended to use version with sealed pilot piston. 04.33.10 - X - 85 - Z
